Q: How to integrate single file in maven project I have a functionality which is sharing the same api service. I have built the component, that makes all the required calls and returns the result. Now I wanted to integrate that component in my project. I do not want to make all the calls in the component, but just call it once and make it serve to all the other project components. The challenge is that my component is not a project in itself. So I cannot include it as a dependency. It is more of a library. What is the way to go about this? Any pointers? A: You can use the maven-dependency-plugin to copy source code to your local repository. Add this to your pom.xml: `org.apache.maven.plugins:b7e8fdf5c8`

structures for databases and ASE Sybase servers that feature no metadata or additional information. The software can extract and process the information contained within backup files, then re-build tables, columns and scripts. The software can read the backup files created with multiple editions of ASE Sybase, from version 12 up to 15. The command line tool can read the backup files, then parse the information regarding structures, data types, columns or indexes. It can store the extracted data in a XML file, then build DDL scripts in order to create database objects and recover structures. It is highly useful, for instance, in case you wish to create a database, relying on an old backup file, which misses pieces of information that the server needs. The usage of the application itself is simple: just run the command line tool, however, you need to create an ASE Sybase script and deploy it first. The command line parameters include the backup file location, the page size of the server that generated the backup file, as well as the output path for the XML file and the DDL script. The data collected by the extractor includes schema name, table names, object IDs, lock schemes, columns and indexes. It gathers information regarding the names, sizes, position, data type, scale, precision or nullable variables, when it comes to columns. Also, the tool searches for the primary key, uniqueness indicator or list of columns, in order to build the indexes.
